

The Global Observing System for Climate

## Paris Agreement GCOS Support of the Global Stocktake

GCOS Steering Committee Meeting  
Helsinki, October 2018

Presentation: Simon Eggleston, Carolin Richter,  
Sybil Seitzinger

Task Team: Florin Vladu, Stephen Briggs, Qinchen Chao, Han Dolman,  
Sybil Seitzinger, Youba Sokona, Michel Verstraete

## Summary

### 2015

- Paris Agreement

### 2016

- GCOS Implementation Plan
  - incl. adaptation, mitigation
- UNFCCC invited full implementation IP

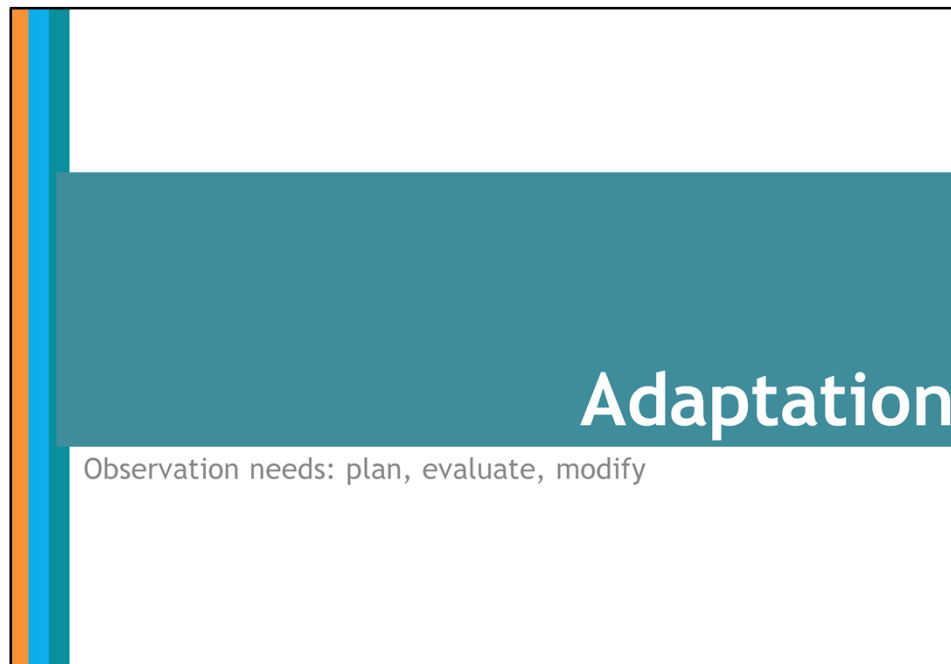

### 2017

- GCOS SC-25 formed Task Team
  - develop plan - observations for adaptation
  - investigate how support mitigation
  - ID initial actions and funding

Identified need for and actions A and M and monitoring 3 climate cycles

3 months to develop position paper  
Report back to panel mtgs March 2018

Obs will be needed to help plan adaptation strategies  
To observe how effective those strategies are  
Provide information that could be used to modify strategies as  
climate change unfolds.

Want to show you three examples of how global climate obs are  
essential to adaptation and how global obs and products derived  
from them can support local planning and adaptation

## Major Actions Identified in GCOS IP

### **Requirements and guidance**

- define user needs
- provide guidance

### **Acquire data**

- produce hi-resolution data
- data rescue
- invest in observations

### **Data**

- improve data stewardship

### **Climate Services**

- climate services
- GFCS

### **Coordination**

- coordination
- long-term research and observations

## Key Climate Hazards Identified for Adaptation INDCs

Let's think for example about adaptation around flooding and some observation needs

Across scales – local to regional to national

Obs will be needed to help plan adaptation strategies

Long term obs extent and timing flooding

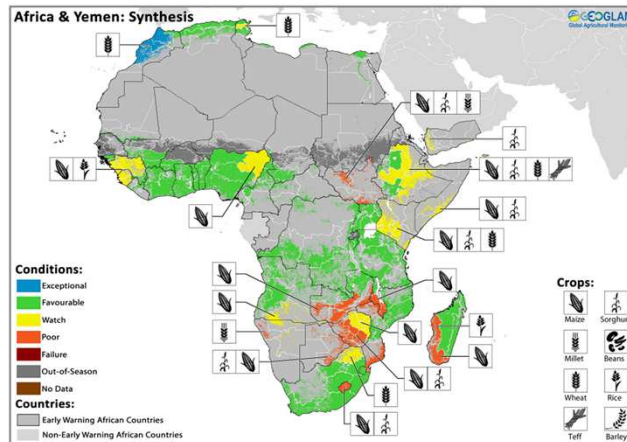

To observe how effective those strategies are

Important development plans/policies resulting in communities moving out of flood zone (obs which communities and if see changes over time)

Provide information that could be used to modify strategies as climate change unfolds.

## Global Crop Monitoring

- NDVI
- Temperature
- PPT anomaly
- Soil moisture
- Runoff

Synthesis map combination of remotely sensed data, ground obs, field reports, national and regional experts. (SOURCE: <https://cropmonitor.org/>)

Crop production many parts world impacted by cc  
Need for adaptation at many levels

Build on existing programs

In this case, Global Agriculture Monitoring (GEOGLAM) and Agriculture Marke Information System (AMIS) providing information within countries at risk of food insecurity usig remotely sensed data, ground obs, field reports, experts.

Help coordinate policy action in times of market uncertainty on crop conditions and markets at regional, national and global scales

Also monitor over time whether food production, location; areal extent; crop type; etc. is changing in response to changing climate

NDVI - Version-5 MODIS/Terra Surface Reflectance products

Temperature

PPT anomaly – NCEP-DOE reanalysis 2 productions

Soil Moisture anomaly -

Evapo-transpiration - **Evaporative stress index** Hourly land-surface temperature and insolation from geostationary satellites such as GOES-East and West and Meteosat Second Generation (MSG), leaf area index and albedo from MODIS sensor, and surface meteorological and atmospheric temperature profile data from the North American Regional Reanalysis (NARR) dataset.

**Runoff** MERRA-2 meteorological variables (list) are provided by NASA GMAO. The NASA Global Modeling and Assimilation Office (GMAO) The Modern-Era Retrospective analysis for Research and Applications, version 2 (MERRA-2) is available from 1980-present (~2 week latency) at 0.625° x 0.5° lon-lat spatial resolution. CHIRPS rainfall is provided by UCSB Climate Hazards Group. CHIRPS is available from 1981-present at 0.05° x 0.05° lon-lat spatial resolution.

### Finance

WIS provides data resources for insurance sector –

Enhance understanding nature windstorms over European continent

Target groups are **insurers, reinsurers, and insurance industry service providers interested in risk models**

Also supports planning for impact of cc on other sectors such as **energy, transport, civil engineering, govt**

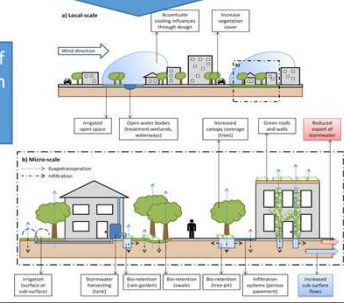

# Urban Heat Islands and Human Health

Overall impact of these actions can be monitored remotely

Expected Mortality leads to Actions to cool Cities

GCOS Task Team on Adaptation, Terrestrial Observation Panel for Climate, Nigel Tapper, 2018.

## Other Examples Monitoring Needs

- Built environment
  - Track land footprint renewable energy
  - Near ground level wind speed
  - Heat loss from buildings
- Early warning
  - Ppt intensity, lightning, flooding.....
- Human health and food production
  - Heat waves
  - Day/night
  - Shifts growing season
- Development new sensors/capabilities

**Monitoring for the Paris Agreement – all are possible inputs to the Global Stocktake through the Transparency Framework**

**Mitigation**

Observation needs

## Examples - Monitoring Needs

- Entire global C cycle

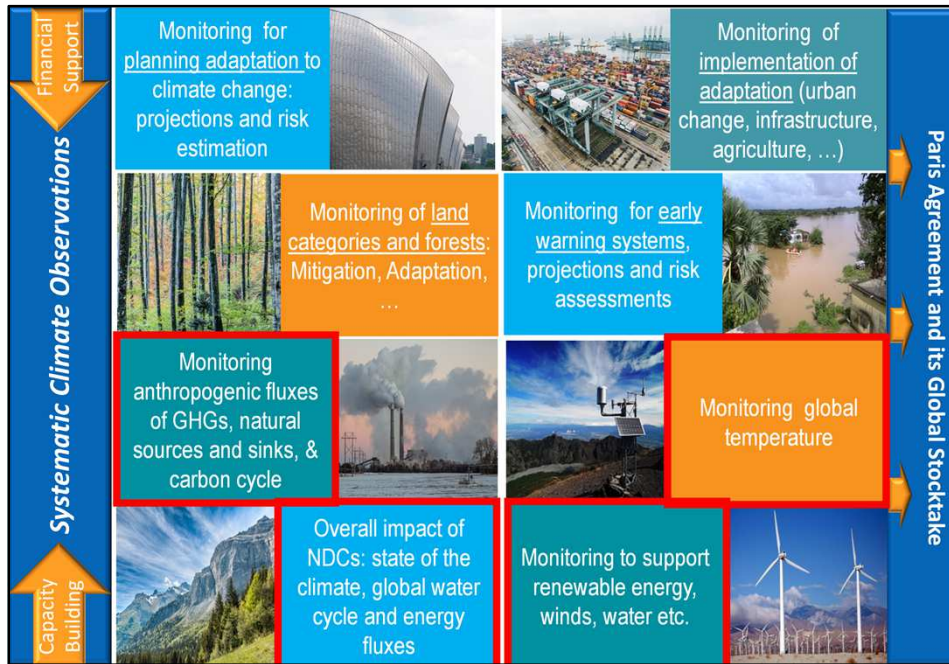

- Sinks ↑ ↓
- New natural sources

- Including --

- Strengthen forests
- Other land uses (agriculture, wetlands, ....)
- Above ground biomass
- Soils
- Permafrost
- Fires
- Ocean ecosystems
- Coastal sinks
- .....

**Monitoring for the Paris Agreement – all are possible inputs to the Global Stocktake through the Transparency Framework**

Existing ECVs – additional

# Indicators

For describing the rate and range of climate changes, and also becoming an input into the UNFCCC

# WMO Climate Indicators

### Mean Temperature

### Ocean Acidity

### Atmospheric CO<sub>2</sub>

### Glacier Mass Balance

### Ocean Heat Content

### Sea Level Change

### Sea Ice Extent

### Arctic

### Antarctic

# GCOS Agreed and Candidate Indicators

	Temperature and Energy	Atmospheric Composition	Ocean and water	Cryosphere	Biosphere
Global Indicators	<ul style="list-style-type: none"> <li>Surface Temperature</li> <li>Ocean Heat</li> </ul>	<ul style="list-style-type: none"> <li>Atmospheric CO<sub>2</sub></li> </ul>	<ul style="list-style-type: none"> <li>Ocean Acidification</li> <li>Sea Level</li> </ul>	<ul style="list-style-type: none"> <li>Glacier Mass Balance</li> <li>Arctic and Antarctic Sea Ices</li> </ul>	
Indicators under development	<ul style="list-style-type: none"> <li>Heat Waves</li> </ul>		<ul style="list-style-type: none"> <li>Heavy Precipitation</li> <li>Droughts</li> </ul>		<ul style="list-style-type: none"> <li>Ecosystem change</li> </ul>
Supplementary Indicators	<ul style="list-style-type: none"> <li>Top of atmosphere energy balance</li> </ul>	<ul style="list-style-type: none"> <li>Methane</li> <li>N<sub>2</sub>O</li> <li>Halocarbon GHG</li> </ul>	<ul style="list-style-type: none"> <li>Water</li> </ul>	<ul style="list-style-type: none"> <li>Snow extent</li> </ul>	

## Summary GCOS Actions Going Forward

### Observations vital success Paris Agreement

#### Adaptation

##### Needs and requirements

understand user needs  
develop (regional/global) observational requirements

**Additional adaptation experts** (e.g. financial, risk, implementation, policy...)  
+ GCOS Science panels

**Obs support planning, implementation, monitoring**

**Open access to data and information**

**Progress can start now and continue to be develop**

#### Mitigation

GHG conc., emissions, removals

Existing ECV contribute to supporting adaptation, **GCOS needs specific activity**

Better understand **Needs and requirements**

understand user needs  
develop (global) observational requirements

Includes ability to understand and estimate risks (current and future)

**Need for additional adaptation experts**

+ obs experts GCOS Science panels

**Lead to identification new observations methods and approaches**

**Obs support planning and monitoring (where needed but not being implemented or not effective) – status of adaptation**

**Open access to data and information greatly** increase ability of countries to design, implement effective adaptation strategies and tactics and better implement early warning systems

GHG conc. – along with inverse models – help support Emissions, removal estimates submitted to UNFCCC

Provide independent global estimate emission and removal, indicate changes natural sources and sinks (processes) that can impact conc. GHG

## Identified improvements in observing system

### 16 Actions Noted

- Implement GCOS IP
- Specific Activity
- New sensors adaptation
- Local obs - adaptation
- Free and open data
- Cooperation Mechanisms

#### Specifically

- Urban areas, radar, lightning obs, GHG fluxes
- Land cover, biomass, soils, permafrost, forests, ecosystems
- Extreme events
- Hydrosphere, biosphere
- Earth's energy budget

The Global Observing System for Climate

## Additional Discussion: How Should GCOS Support the Global Stocktake?
